

Bespoke Bevelled Edge

The glass we use for our Bespoke products differs from a standard mirror so that when the Aquavision is switched on it can be viewed clearly, however when it is off, the glass appears to be fully mirrored.

Whereas a standard mirror has a coating on the back to achieve the mirror effect, our Bespoke MirrorVision+ glass is made with a specialist treatment coating on the front. The mirror effect is completed by having a black backing to our glass which is created by painting the rear except for the viewing window for the Aquavision. When the Aquavision is switched off, this acts as the black backing in this area which completes the mirror effect.

When the glass edges are bevelled, the coating on the front is removed and because of this the mirror effect is also removed. The edges would therefore appear black in colour.
